Hunar: where we are

What we have built so far, and what is left. Simple summary, 12 November 2026.

What Hunar is. Many workers learned their trade on the job and have no certificate. Hunar helps an assessor check their skills against the official national standards. The AI only *suggests*; the assessor always makes the final decision.

What we have built

Everything below is in the app and saved on GitHub. All automated tests pass.

The app

- Works on a phone and keeps working without internet; it sends everything when the connection comes back.
- Sign in with phone number and PIN. Roles: worker, customer, assessor, facilitator and admin.
- Asks for consent before collecting anything, following India's data protection law (DPDP Act).

For workers

- Register, choose a trade (electrician, plumber or carpenter) and take a short skill quiz straight away. A rushed quiz does not count.
- Tell their experience by typing or speaking, in Hindi, English or Hinglish. Hunar finds the closest official qualification and shows which requirements match.

For customers

- Find workers near them by trade and PIN code, and book a job.
- A “skills checked” badge appears only after an assessor has signed off.

For assessors

- Practical task checklists for electricians (6 tasks), plumbers (4), carpenters (4) and a ceiling-fan pilot (4), each linked to an official skill standard. The plumber, carpenter and fan tasks are drafts.
- Photos need consent, faces are blurred before saving, and re-used photos are flagged.
- For each skill Hunar suggests a level with the reason. The assessor accepts or changes it, and every decision goes into a log that cannot be secretly edited.

Video pilot (ceiling fan)

- The worker records one short clip per fan part. Faces are blurred and the sound is removed before saving.
- Speech becomes text, and Hunar marks the moment each part is named, explained and tested. A meter reading is checked against the value printed on the part.
- A detector checks whether the part is in view. Its “hand on the part” check stays off until we have labelled frames to set it properly.

Languages and documents

- English and Hindi are complete. The language menu has 23 languages; the other 21 need Bhashini keys.
- Project report, slide outline, viva questions, demo script and README are ready. Every number in them comes from the code, and results we do not have yet say “RESULT PENDING”.

What we can and cannot say yet

So far Hunar has only been tested on made-up (synthetic) examples and public data, not on real workers. That proves the system works from start to end, but not how accurate it is for real people. The real numbers need the team's help (next page).

What is left

These need people. Claude cannot record videos, sign forms, get keys or act as an expert.

#	What	Who	Why it matters
1	Get Bhashini keys and put them in the .env file	Team	Turns on the 21 other Indian languages and Indian-language speech to text.
2	Signed consent forms, then 20 short fan clips and 2 full runs on an unplugged fan (one done properly, one that skips a part)	Team	Real material for the video pilot.
3	Write down what was said in the 20 clips, and label 100–200 frames (part visible? hand on it?)	Team	Measures speech accuracy and the frame check, and switches the hand check on.
4	Expert checks: an assessor for each trade, an appliance technician for the fan tasks, trade experts for the quiz questions, native speakers for the translations	Experts	Turns the draft tasks and questions into reviewed ones.
5	Team members write real worker experience stories	Team	First real result for the qualification matching.
6	About 100 real quiz attempts for each trade	Workers / team	Lets us set the quiz difficulty from real answers.
7	2–3 assessors score the same cases	Assessors	Shows how consistent scoring is between assessors.
8	Train the safety-gear detector again on Colab (run 2)	One team member	The detector's accuracy result.
9	Paperwork: team names, SAP IDs, guide and college in the synopsis and report; update the “Where we are” slide	Team	Ready to submit.

Where to start

1. Consent forms and the 20 fan clips: the biggest missing piece. 2. Bhashini keys: quick to get, and they unlock the other languages. Everything else can follow in any order.

What happens after that

Once the team shares any of these, Claude runs the measurements, puts the real numbers into the README, report and slides, and labels clearly what is real and what is still pending.
